

Grow world economy by several times,
spending just a few \$millions:

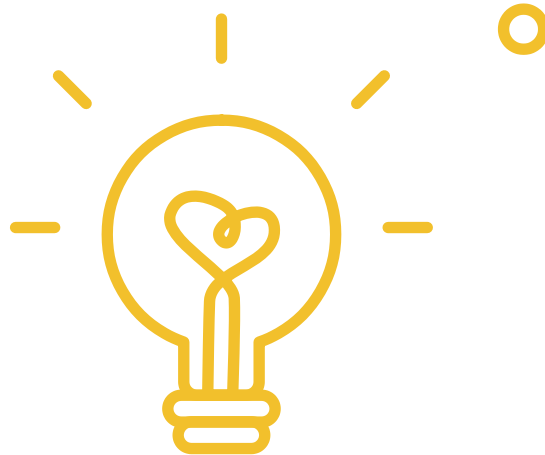

Solve science publication.

AI Internet-Meritocracy

Personal Story

I have been removed from Academia in Russia for my religion. Therefore I have problems with my math research recognition. Need to circumvent this.

The Problem

- Some **scientific discoveries** don't receive **publicity**. It causes the world economy to **lag by several times**. The same is with **FOSS**.
- The **traditional methods of funding** are too bureaucratized (e.g. **only** for **PhDs**) and involve too much work.

The Solution

My app asks AI, which portion of the global GDP a user deserves and gives him this share of funds.

Later also create new occupation – science marketers.

Please, donate

Please, **donate** to AI Internet-Meritocracy (AIIM) project.

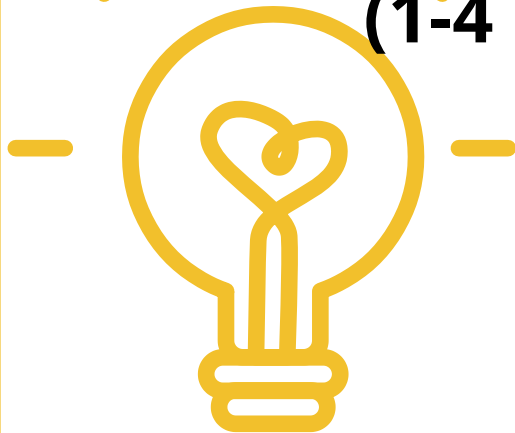

01

- Node.js app is ready (except of security review – **a few days**).

02

- Rewrite it as fully on-chain ICP app (**1-4 months**).

Roadmap

03

- Support ERC-20 tokens, etc. (**a few days**)

04

- Publicity + misc (ongoing).

Implementation

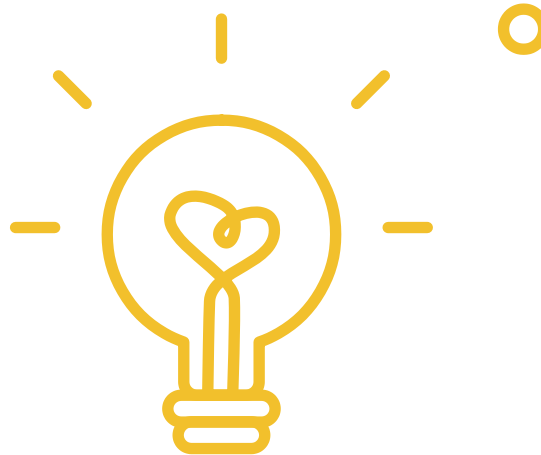

- Node.js (ready, but no security review yet), rewrite in ICP/Motoko.
- Support OpenAI batches (ready, but not debugged).
- Query OpenAI accordingly a graph of dependencies in DB (now SQL; when will be fully on-chain, ZenDB).

Market Size

I think, nothing prevents this project to become greater than Gitcoin and Giveth combined.

In the US, total charitable giving reached \$592.50 billion in 2024.
